

Can you tile a set of hexominoes with a set of similar but smaller hexominoes?

Cut out the small hexominoes to the right, and use them to cover each of the big hexominoes below.

This is called a **self-tiling tile set**, and it was discovered by Lee Sallows in 2012. It is the only one made of 4 hexominoes! More information at <http://www.leesallows.com/>

Hint: You may need to flip a small hexomino.
